GoNime - One-Page App Summary

What It Is

GoNime is a Go-based terminal app for watching anime/movies and reading manga.
It combines a Cobra CLI with a Bubble Tea TUI and optional browser-based manga viewer support.

Who It Is For

Primary persona: terminal-first anime/manga users on desktop (Windows/Linux/macOS).
Detailed user demographics or business persona definition: Not found in repo.

What It Does

- Searches and browses anime/movie catalogs from phimapi, ophim, and nguonc sources.
- Searches and reads manga from otruyen and truyenvn sources.
- Plays episode URLs using external players (mpv or vlc), with browser fallback.
- Supports episode downloading via yt-dlp integration.
- Shows watch/read history and favorites, persisted locally.
- Renders poster/thumbnail images in terminal via chafa with local caching.
- Provides settings and command entry points (anime, manga, history, settings, version).

How It Works (Architecture Overview)

- CLI entry: cmd/gonime/main.go defines Cobra commands and launches Bubble Tea TUI models.
- UI layer: internal/tui handles menus, search screens, episode/chapter views, history, favorites, settings.
- Source adapters: internal/api (phimapi/ophim/nguonc) and internal/scraper (otruyen/truyenvn)
- expose registry interfaces and return trending/search/detail/chapter/episode data.
- Playback/download: internal/player resolves player binaries, starts playback, and wraps yt-dlp downloads.
- Media rendering: internal/render downloads image assets and renders them in terminal through chafa.
- Persistence: internal/config stores config.json, history.json, and favorites.json in the user config directory.
- Optional viewer: internal/viewer serves local frontend files via HTTP and opens browser for manga viewing.
- Remote services: public anime/manga APIs and websites are used; backend service owned by this repo: Not found in repo.

How To Run (Minimal)

1. Install Go 1.24+ and one video player (mpv or vlc).
2. From repo root: go mod tidy
3. Run app: go run ./cmd/gonime
4. Optional direct commands: go run ./cmd/gonime -- anime | manga | history | settings | version
5. Optional tools for full experience: chafa (thumbnail rendering), yt-dlp (episode download).
